VN808CM-32-E

Octal channel high side driver

Features

Type	$R_{DS(on)}$	I_{out}	V_{CC}
VN808CM-32-E	160 mΩ	1 A	45 V

- CMOS compatible input
- Junction over-temperature protection
- Case over-temperature protection for thermal independence of the channels
- Current limitation
- Shorted load protection
- Undervoltage shut-down
- Protection against loss of ground
- Very low stand-by current
- Compliance to 61000-4-4 IEC test up to 4 kV

PowerSO-36

Description

The VN808CM-32-E is a monolithic device designed in STMicroelectronics VIPower M0-3 technology, intended for driving any kind of load with one side connected to ground.

It can be driven by using a 3.3 V logic supply.

Active current limitation combined with thermal shutdown and automatic restart, protect the device against overload. In overload condition, channel turns OFF and back ON automatically so as to maintain junction temperature between T_{TSD} and T_R. If this condition makes case temperature reach T_{CSD}, overloaded channel is turned OFF and will restart only when case temperature has decreased down to T_{CR}(see waveform 3 *Figure 6 on page 10*). Non overloaded channels continue to operate normally. Device automatically turns OFF in case of ground pin disconnection. This device is especially suitable for industrial applications conform to IEC 61131

7 Reverse polarity protection

A schematic solution to protect the IC against a reverse polarity condition is proposed.

This schematic is effective with any type of load connected to the outputs of the IC.

The R_{GND} resistor value can be selected according to the following conditions to be met:

1. $R_{GND} \leq 600\ mV / (I_S$ in ON state max).
2. $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where $-I_{GND}$ is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device datasheet.

The power dissipation associated to R_{GNG} during reverse polarity condition is:

$PD = (-V_{CC})^2/R_{GND}$

This resistor can be shared by several different ICs. In such case I_S value on formula (1) is the sum of the maximum ON-state currents of the different devices.

Please note that if the microprocessor ground and the device ground are separated then the voltage drop across the R_{GND} (given by I_S in ON state max * R_{GND}) produce a difference between the generated input level and the IC input signal level. This voltage drop will vary depending on how many devices are ON in the case of several high side switches sharing the same R_{GND}.

8 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
